

# Cloud. SSO Support

Since **WatchTower version 2.0.0**, the app can add Jira Server sources accessible via SSO. The app accesses such sources using Personal Access Token.

Available natively from *Jira 8.14.0 and above*  
With the Resolution SSO addon for versions *below 8.14.0*

**Personal access tokens (PATs)** offer a secure way to integrate external applications with your WatchTower app, providing a safe alternative to using username and password for authentication.

**Add Jira Source**

Jira URL \*:  URL of the Jira instance you want to connect to.

**Connected**

Authorization: Username/Password  Personal Access Token

Access Token \*:

JQL: **Waiting for Authorization...**

Source Name \*:

Source Key \*:

Source Color:

**Connected to: Jira Rozdoum - 8.5.3**

## Creating PATs for your Jira

1. In Jira, select your profile picture at the top right of the screen, then choose **Personal Access Tokens**.
2. Select **Create token**.
3. Give your new token a name.
4. Optionally, for security reasons, you can set your token to automatically expire after a set number of days.

The **EXPIRES SOON** status appears 5 days before the actual expiration date. Once the token expires, you can't reactivate it. You must create a new token.

5. Click **Create**.

Your personal access token is created. Copy the token and store it in a safe space. [Learn more](#)
